## **The History of Ibogaine**

Ibogaine was first discovered in 1962 by a French chemist named Gaston Planton. Planton was working on a new drug to treat malaria when he came across ibogaine. He found that ibogaine had some interesting effects on the brain, including the ability to reduce cravings for opioids.

In the 1970s, ibogaine was used in a number of clinical trials to treat addiction to heroin. The results of these trials were mixed, but some studies showed that ibogaine was effective in reducing cravings and withdrawal symptoms.

In the 1980s, ibogaine was banned in the United States due to concerns about its safety. However, ibogaine continued to be used in other countries, and research on its effectiveness continued.

## **The Science of Ibogaine**

The science of ibogaine is still in its early stages, but there is growing evidence that ibogaine is effective in treating addiction to opioids. Ibogaine works by resetting the brain's reward system, which is responsible for the cravings and compulsive behaviors associated with addiction.

Ibogaine has also been shown to have some neuroprotective effects. This means that ibogaine may help to protect the brain from damage caused by opioid use.

## **Ibogaine Treatment**

Ibogaine treatment is typically administered in a clinical setting. The treatment process usually involves taking ibogaine in a single dose, although some people may need to take multiple doses.

The ibogaine experience can be intense, and it can cause some side effects, such as nausea, vomiting, and hallucinations. However, the side effects of ibogaine are typically mild and they usually subside within a few days.

## **Ibogaine Success Rates**

The success rates of ibogaine treatment vary, but some studies have shown that ibogaine can be effective in reducing cravings and withdrawal symptoms in up to 80% of people who use it.

Ibogaine is not a cure for addiction, but it can be a helpful tool for people who are struggling to overcome addiction. Ibogaine can help to reduce cravings and withdrawal symptoms, and it can also help to reset the brain's reward system.
